

SalesSupport Server (3S) - Clean. Data. Delivered.

Turns Product Data into a Sales Proposition

Masterdata Management

The benefits of Vendor Managed Inventory (VMI) are undisputed. Why not impress your customers with the same kind of service for the digital factory? The SalesSupport Server does just that. As a central information hub, 3S helps you to consolidate product information from various data sources into a single database. It's the distribution center of the digital world! 3S puts you in the position to package and ship tool data to your customers via all conceivable information channels.

- **Imagine** your customers having up-to-date product information readily available at their desktop 24/7.
- **Imagine** your product management only needing to maintain only a single database for multiple information channels.
- **Imagine** a single source of truth for product management and a server that can be integrated into your website via API.

Best of all: You will also be in control of your product data! 3S tracks and monitors where the data went and provides detailed web analytics for all websites that the 3S furnishes with data. And that includes your own website, your distributors' websites and public websites like ToolsUnited.

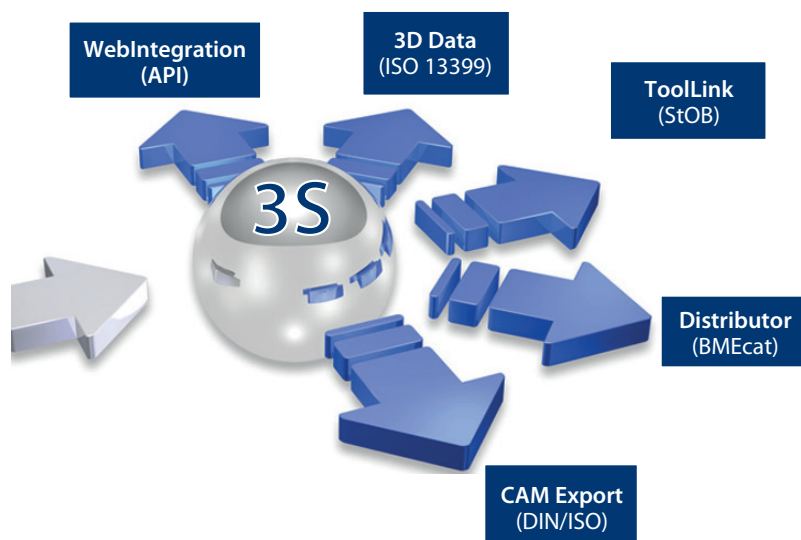

3S delivers all that.

Standard features include:

- Single data record administration via graphical user interface
- Bulk data maintenance via Excel

- Standard classification according to DIN and ISO including conformity classes
- Category and property editor for extending and adapting the data structure
- Revision history, user rights and access management
- Tool cart for the creation of tool libraries
- Customer management
- Standard export formats (Excel, DIN4000-102 and ISO P21)

Supply chain integration comes on top. Your 3S may be directly connected to ToolsUnited and all customers that operate a ToolLink portal. This makes 3S the 100% solution, because it goes well beyond catalog tooling.

CIMSOURCE promise:
With 3S you will have your tool data to 100% under control.

The **Web Integration** allows the functions of the SalesSupport Server to be integrated into your own website. This way you can quickly provide a „MyToolsUnited“ solution for your customers, or you can integrate your own User Interface (UI) via the API.

WebAnalyzer is a Business Intelligence (BI) application and allows you to analyze the access patterns and downloads on both ToolsUnited and on your own web site.

The **Webshop** handles purchase transactions via a shopping cart function. The shopping carts are filled via the ToolsUnited search. Customer-specific prices, stock availability and user management are realized via a connection to the ERP system. The SalesSupport Server database supplies the product data.

Data is the new oil

The imperative of the Internet must be put into perspective when it comes to product data. Because a closer look reveals: it is the metadata that is worth its weight in gold. With WebAnalyzer, you can get exactly these access patterns and user profiles from your online sales partners as well.
